

Included in this zip file is the replication kit for "The Effects of Naloxone Access Laws on Opioid Abuse, Mortality, and Crime" by Jennifer L. Doleac and Anita Mukherjee.

For questions/comments, please e-mail anita.mukherjee@wisc.edu.

There are four folders in the replication kit, each containing Stata codes that produce all the tables and figures related their respective datasets:

- "Crime": National Incident-Based Reporting System (NIBRS) and FBI's Law Enforcement Officers Killed and Assaulted (LEOKA);
- "Mortality": Mortality data from the Centers for Disease Control and Prevention (CDC);
- "HCUP": Opioid-related ER visits from the Healthcare Cost and Utilization Project (HCUP);
- "Google Trends": Online searches for “naloxone” and related queries on Google.

All datasets except the CDC county level mortality data were obtained from public sources and are available in their respective folders. The CDC county level mortality data can be obtained by contacting the CDC and following the procedures related to access this restricted information.
